

FINANCEFORSTUDENTS - ONE-PAGE APP SUMMARY

Repo-based summary (HTML/CSS/JS evidence only)

WHAT IT IS

FinanceForStudents is a static multi-page educational web app for business and finance learning. It combines guided lessons, quizzes, workshop scheduling, a dashboard, a stock simulator, and an in-page finance chatbot.

WHO IT IS FOR

Primary persona: students (especially finance/business learners) who want peer-oriented, self-paced practice with tutoring/workshop support. Evidence: home page states "created by students, for students" and pages are lesson-centric.

WHAT IT DOES

- Provides six structured lessons with a step flow: Content - Activity - Video - Quiz.
- Tracks lesson completion and quiz averages in localStorage.
- Shows dashboard progress, badges, streaks, and next-lesson guidance.
- Offers a schedule/calendar with RSVP and custom user-added group study events.
- Includes a stock market simulator with virtual \$10,000, buy/sell trades, and portfolio charting.
- Supplies downloadable study materials generated in-browser (HTML/CSV files).
- Embeds a finance chatbot that tries Gemini API and falls back to rule-based answers.

HOW IT WORKS (COMPACT ARCHITECTURE)

- Frontend: standalone HTML pages (index/resources/schedule/dashboard/stock-game/profile/lessons) sharing css/styles.css and css/pages.css (plus css/home.css on landing page).
- JS modules: js/app.js, js/lessons.js, js/lesson-steps.js, js/calendar.js, js/stock-game.js, js/chatbot.js, js/quizzes.js, js/downloads.js.
- Data flow: user actions -> JS event handlers -> DOM updates and localStorage writes -> pages recompute and render progress/state on load.
- State keys seen in repo: financeForStudents_lessonProgress, financeForStudents_quizScores, ffs-rsvps, ffs-custom-events.
- External dependencies: Chart.js (CDN in stock-game.html), Gemini HTTP endpoint in chatbot.js.
- Backend/API auth server: Not found in repo.
- Persistent database/multi-user account system: Not found in repo.

HOW TO RUN (MINIMAL GETTING STARTED)

1. From repo root, open index.html directly in a browser.
2. Or run: `python -m http.server 8000`
3. Visit: `http://localhost:8000/index.html`
4. No package manager, build step, or bundler found in repo.

Evidence scope: page HTML files, js/* modules, css/* styles, and CLAUDE.md.
